

JAMES OLUSOGA

■ Software Engineer — Python / TypeScript · production AI systems for paying clients

Toronto, ON · Hybrid downtown or remote · tdotssolutionsz@gmail.com

linkedin.com/in/james-olusoga · github.com/DareDev256 · jamesdare.com

github.com/DareDev256 — 20 public repos · 140 stars · **Clients:** Edson Legal (since 2013) · BetMetrics.ca (paid build, 2026)

Live now: BetMetrics.ca — sole engineer, 377+ registered users, about 800 wagers, odds from 11 sportsbooks, settlement every 30 min (paid build, 2026).

Published: fcp-mcp-server — first MCP server for Final Cut Pro, on PyPI and in the official MCP registry: 109 stars, 20 forks, 1,808 tests.

Private by design: Edson Legal (client since 2013) and a USDA-ARS research scientist (3,632 cited chunks, every answer to the page) — embeddings and small models run on the machine; only what is allowed reaches a frontier model.

Looking for: a production AI engineering seat on a delivery team. Ten years shipping on my own for named clients who pay for it; this would be my first seat inside a team, and I say so plainly.

What I do: I build systems where the model's answer has to be right, not plausible, and I run my own delivery lifecycle in Claude Code every day. The AI work is 2025 onward and dated as such. Everything before that is software, automation and production work.

EXPERIENCE

Lead Developer, contract

BetMetrics.ca — Toronto | May 2026 – Present, paid engagement

- Sole engineer on a live multi-sport analytics platform for a business owner: 377+ registered users, about 800 wagers placed, odds from 11 sportsbooks, settlement every 30 minutes on Convex.
- Built to Ontario gaming compliance shape: KYC, age verification, responsible-use disclosures, audit-logged admin actions, role-based access. AODA accessibility pass. Mozilla Observatory B+.
- Next.js 16, React 19, TypeScript, Convex, Clerk, Vercel.

Software Engineer, independent

DareDev256 — Toronto | Feb 2025 – Present

- **Poultry research advisor, USDA-ARS scientist (2025–26).** Retrieval over 3,632 chunks of peer-reviewed papers, every answer cited to the page. Deliberately no vector database: the corpus fits in memory and scans in under 10 ms. An eval harness of trap questions gates every release after a safety classifier once refused legitimate questions. The client presents the system himself.
- **fcp-mcp-server (2025–26).** First MCP server for Final Cut Pro. Published on PyPI and in the official MCP registry: 109 stars, 20 forks, 1,808 tests, 88 operations across 63 tools, outside contributors. Drives a live Final Cut Pro instance. Security passes for path traversal and XXE because the server takes file paths from a model.
- **Second Opinion (2026).** Five Claude agents turn a patient chart into a cited brief; a verifier checks every claim against a 52-source corpus and gates the handoff with a green, yellow or red verdict. The corpus sits in the prompt cache, so a warm call pays cache-read price on it (a tenth of base input) instead of full price. Open source.
- **The delivery layer under all of it (2025–26).** Claude Code skills, lifecycle hooks and scheduled jobs on two machines that catch a secret before it is written, a destructive command before it runs, config drift before it ships, and report by exception. Per-call cost and latency tracing.

Web Developer and Workflow Consultant, concurrent client

Edson Legal — Toronto | 2013 – Present

- Thirteen years running the website and intake workflow for a personal-injury firm under Law Society of Ontario rules, PIPEDA and PHIPA. Intake handles medical records, accident reports and insurance-claim documents.
- Kept marketing and intake as separate systems so no client detail ever entered a marketing tool. Earlier automation (reminders, follow-ups, email sequences via Twilio and OpenAI) took the routine follow-up off the front desk.
- **AI intake CRM (2026)** built behind a fail-closed compliance gate: no real client data until the zero-retention workspace and data-processing agreement are signed. That gate is deliberate.

Automation Engineer, independent project

Audi Downtown Toronto — Toronto | Oct 2025 – Dec 2025

- Vehicle workflow tracker built with service advisors, technicians and managers: kanban state engine across detailing, service and delivery, role-based views, works offline through network drops.

Earlier

Nin Online, Steam MMORPG — community strategy and wiki tooling, part-time, 2019 – 2026; NinWikiBot adopted by the game's developers, open-sourced as [fandom-wiki-bot-template](#). **Forest Hill Real Estate** — creative technologist, 100+ branded video campaigns, 2021 – 2025. **Tdotssolutionsz / KushdUp**

Filmsz — founder and executive producer, 101 music videos, Music Canada Gold certified, 2010 – 2019, sold.

How I work

- Spec first, then code. The brief is written before generation starts, and the review checks the output against acceptance criteria, not style.
- A green test is not evidence. Before I trust a check I ask what a failure would look like through it. I delete guards to see a test go red, look for functions called by nothing but their own test, and verify against the deployed artifact rather than the build log.
- I have been wrong in ways I can name: a green unit test defending a mislabel, a deleted constant that passed import and failed only inside the handler, a scheduled job that reported success for weeks while dead. Each one became a check that now runs on every build.
- Sensitive data stays local. For the law firm and the research client I run embeddings and small models on the machine (Gemma, Qwen) and send only what is allowed to a frontier model.

SKILLS

Languages and frameworks: Python 3.12 (FastAPI, asyncio, pytest), TypeScript, Node.js, React 19, Next.js 16, Convex, PostgreSQL, SQLite

AI engineering: Anthropic, OpenAI and Gemini APIs; multi-agent orchestration built directly on the provider SDKs (LangChain and LangGraph evaluated, not shipped); RAG with citation grounding; structured outputs; prompt caching; Model Context Protocol, one published server and one in private production; local inference with Gemma and Qwen for sensitive data

Delivery and verification: Claude Code daily; spec-driven development; eval harnesses and regression suites; mutation and reachability checks; Playwright; GitHub Actions; Vercel; PM2 and launchd on two machines

Regulated work: PII and PHI handling under PIPEDA and PHIPA; Law Society of Ontario confidentiality; Ontario gaming compliance shape (KYC, age verification, audit trails); OWASP-aligned review

CERTIFICATIONS

AWS Certified AI Practitioner (2026) · **Google Cloud Generative AI Leader** (2025) · **IBM Professional Certificates** (2024–25): Generative AI Engineering, AI Engineering, AI Developer, Full Stack Software Developer, AI Product Manager
